RIGOL Malaysia - IT User Guide

Bing Yan Gong Quong Ting Fu | Modified November 13

This guide helps employees handle common IT issues in daily work. It provides easy, step-by-step instructions, troubleshooting tips, and best practices for using company systems and software. By following this guide, users can quickly fix minor technical problems, reduce downtime, and keep IT operations running smoothly and securely across the organization.

Who should use this guide

All RIGOL employees who use company computers, email, and business applications.

It is especially useful for staff who want to solve basic IT issues on their own before contacting the IT Operations Team.

Software and System Setup Guide

1. **Email (Outlook) set up**
   - Set up RIGOL email on Android - Add or Remove RIGOL Email Account on Android
   - Set up RIGOL email in iOS (iPhone or iPad) - Set up email in iOS phone
   - Set Up Feishu email in Feishu app - Setting Up Feishu Email for Company Emails
   - Accessing RIGOL Email via Browser - Step-by-Step: Accessing RIGOL Email via Browser
   - **Good to know:** Announcement: Email Feature Now Available in Feishu - Announcement: Email Feature Now Available in Feishu
2. **Feishu set up**
   - Install Feishu app on mobile phone (Android and iOS Platforms) - Install Feishu app on mobile phone (Android and iOS Platforms)
   - **Good to know:** RIGOL Feishu (V7.42) Upgrade Guide - RIGOL Feishu (V7.42) Upgrade Guide
3. **Printer set up**
   - How to Print, Photocopy, and Scan to Email Using the RIGOL Penang 2F Printer (Canon iR-ADV C5235) - How to print, photocopy & scan to email using RIGOL Penang 2F Printer (Canon iR-ADV C5235)
4. **MES and SAP**
   - Steps to apply MES and/or SAP account - Steps to apply MES and/or SAP account
   - RIGOL SAP Installation Guideline - RIGOL SAP Installation Guideline

1. Introduction

I completed my internship at RIGOL Technology Malaysia, where I was assigned to the IT Department as a Desktop IT intern. RIGOL Technology Malaysia is a technology company specializing in electronic test and measurement instruments, and it relies heavily on stable and efficient information systems to support its daily operations. Throughout the internship period, I worked in an office IT environment and gained exposure to enterprise-level IT support and management. This internship provided me with valuable hands-on experience and a deeper understanding of how an IT department functions within a professional corporate setting.

During my internship, my main responsibilities involved providing technical support to office staff by resolving various IT-related issues encountered in their daily work. These tasks included troubleshooting computer system problems, assisting with software installation and configuration, resolving network connectivity issues, and supporting the use of peripheral devices. In addition, I participated in the management of the company's electronic equipment, such as computers and other IT assets, by assisting with inventory recording and organization. I was also involved in creating an IT user manual for employees, in which I summarized common IT problems and their corresponding solutions to improve efficiency and support the company's IT management system. Through these tasks, I learned how to operate Active Directory (AD), manage the Windows operating system, and understand the basic structure and maintenance of a local area network (LAN).

My industrial supervisor was Mr. FU QUONG TING (Dennis), who is responsible for overseeing and managing the overall IT operations of the company. His duties include identifying and resolving company-wide IT issues, improving and maintaining IT infrastructure, managing employee network and system access permissions, and maintaining server systems in the server room.

2. Organization's Background

RIGOL Technologies is a globally recognized technology company specializing in the development, manufacturing, and distribution of electronic test and measurement instruments. Established in 1998, the company has continuously focused on innovation and technological advancement, gradually expanding its presence in the international market.

RIGOL's core business areas include electronic measurement solutions such as oscilloscopes, signal generators, spectrum analyzers, power supplies, and other advanced testing instruments. These products are widely used in education, scientific research, industrial manufacturing, and electronic engineering fields. With strong research and development capabilities and a commitment to high-quality standards, RIGOL integrates hardware design, software development, and system-level solutions to meet the diverse needs of global customers.

RIGOL Technology Malaysia is an important overseas branch of the company and is strategically located in the Bayan Lepas Industrial Zone in Penang, one of Malaysia's major electronics and manufacturing hubs. The Malaysia branch has an organizational size of approximately 100 employees and operates within both office and production environments. The office area consists of several functional departments, including Information Technology (IT), Finance, Administration, Human Resources (HR), Research and Development (R&D), Marketing, and Customer Service, each supporting the company's daily operations and long-term strategic goals. The production area is equipped with advanced and highly automated manufacturing facilities, including EMD and SMT production lines, which enable efficient and precise assembly of electronic components. These automated production processes ensure product quality, consistency, and timely delivery.

The Malaysia branch primarily focuses on market expansion, product manufacturing, and global product distribution, while also supporting the development of new products. In addition to its manufacturing responsibilities, the branch plays an important role in supply chain coordination and customer support, strengthening RIGOL's presence in the Southeast Asian and international markets. By combining office-based management functions, automated production capabilities, and technical support services, RIGOL Technology Malaysia contributes significantly to the company's global operations and reflects RIGOL's commitment to technological excellence, operational efficiency, and continuous growth.

3. Tasks Performed / Projects Involved

Projects Involved During the Internship

During my internship, I was involved in multiple IT projects that supported enterprise desktop environments, network infrastructure, production line operations, and internal IT standardization. These projects were not limited to routine technical tasks, but were carried out with clear objectives, structured execution, and measurable outcomes. My role mainly focused on desktop IT support, endpoint deployment, infrastructure coordination, and documentation, allowing me to gain hands-on experience in real enterprise IT environments.

Enterprise Desktop Environment Standardization and Lifecycle Management Project

One of the most significant projects I participated in was the enterprise desktop environment standardization and lifecycle management project, which aimed to unify system configurations, improve manageability, and reduce support complexity across office and production environments. My responsibilities included supporting operating system reinstallation for new employees, deploying standardized Windows 11 enterprise images, and assisting in upgrading legacy systems. In addition to system installation, I participated in configuring user environments, domain-related settings, and enterprise software packages. I also learned how desktop IT teams manage software compatibility, license compliance, and version consistency across different departments. This project exposed me to key desktop IT concepts such as endpoint lifecycle management, standard operating environments (SOE), image-based deployment strategies, and post-deployment validation. The standardized deployment approach significantly reduced setup time per device and minimized configuration-related issues reported by users.

Endpoint Connectivity, Network Awareness, and Infrastructure Coordination Project

Another major project I contributed to be the endpoint connectivity and infrastructure coordination project, which focused on strengthening the relationship between desktop devices and the underlying network infrastructure. My tasks included verifying switch port assignments, identifying endpoint-to-port mappings, and updating documentation to reflect actual physical and logical connections. I also assisted in reviewing data center and server room network topology diagrams to understand how desktop endpoints connect through access switches to core network devices and firewalls. In addition, I participated in checking wireless access points and CCTV devices by validating MAC addresses, IP allocations, VLAN associations, and physical placement according to engineering drawings. Through these activities, I gained a deeper understanding of network segmentation, basic VLAN

concepts, IP management, and how endpoint devices are secured and isolated within enterprise networks.

Desktop IT Monitoring, Preventive Maintenance, and Availability Assurance Project

I was also involved in a desktop IT monitoring and preventive maintenance project, which aimed to improve system availability and reduce reactive troubleshooting. As part of this project, I assisted in deploying Uptime Kuma to monitor critical endpoints such as CCTV systems, facial recognition devices, and other IP-based equipment. I learned how monitoring tools detect availability issues and how alerting mechanisms help IT teams respond proactively. Beyond monitoring, I participated in preventive maintenance activities, including printer configuration backups, weekly maintenance documentation, and routine checks on production line devices. This project helped me understand the importance of preventive maintenance, backup strategies, and early fault detection in maintaining stable IT operations.

IT Documentation, User Enablement, and Knowledge Transfer Project

Another major project I participated in was the IT documentation and user enablement project, which focused on improving IT service efficiency through knowledge sharing. My responsibilities included creating IT troubleshooting manuals, desktop support FAQs, Feishu software user guides, and printer maintenance documentation. While developing these documents, I learned how to translate technical procedures into user-friendly instructions, balance detail with clarity, and standardize documentation formats. This project strengthened my skills in technical writing, knowledge base structuring, and user education, which are essential for desktop IT roles where effective communication is as important as technical expertise.

Production Line IT Support, Operational Continuity, and Cross-Functional Collaboration Project

In addition to office IT projects, I was actively involved in production line IT support and operational continuity projects. My responsibilities included assisting with deploying computers on the SMT production line, troubleshooting access control terminals, verifying network connectivity for production equipment, and supporting material counting during

production activities. Through close collaboration with production staff, I learned how IT systems directly impact manufacturing efficiency and operational continuity. This project highlighted the importance of rapid incident response, clear escalation procedures, and coordination between IT and production teams in environments where downtime has direct business consequences.

Desktop IT Security, Access Control, and Asset Governance Exposure

Across all projects, I was also exposed to essential desktop IT security and governance practices. This included assisting with user account setup, understanding basic access permission control, device naming conventions, asset tagging, IP allocation practices, and tracking unused or spare devices stored in the warehouse. I learned how proper asset governance, access control, and documentation contribute to IT security, audit readiness, and operational transparency. These practices are critical for maintaining control over large numbers of endpoint devices in enterprise environments.

Overall, these projects allowed me to apply and expand my desktop IT knowledge in real operational scenarios. By participating in structured projects rather than isolated tasks, I developed a holistic understanding of how desktop systems, network infrastructure, monitoring tools, documentation, and user support work together to support both office and production environments.

4. Discussion & Reflection

Throughout the internship, I gained comprehensive benefits in terms of technical knowledge, practical exposure, problem-solving skills, and professional mindset. Working in a real enterprise IT environment allowed me to bridge the gap between theoretical understanding and practical implementation, while also exposing me to the complexity and interdependency of modern IT systems. From a technical perspective, the internship significantly strengthened my understanding of enterprise desktop IT operations. I learned how standardized system images are designed, maintained, and deployed at scale, as well as how operating system updates, security policies, and enterprise configurations affect system behavior. Beyond basic installation procedures, I developed a deeper awareness of system dependencies, update sequencing, and compatibility issues that are often overlooked in theoretical learning.The internship also provided valuable exposure to real production and office environments where IT systems directly support business operations. Supporting production

line equipment, printers, access control devices, and monitoring systems helped me understand the importance of stability, predictability, and fast recovery in operational IT. I learned that even minor configuration issues could lead to production delays, emphasizing the responsibility and precision required in enterprise IT roles. In addition, I gained practical experience in IT documentation, asset management, and internal communication. Preparing user manuals, maintenance records, and troubleshooting guides taught me how structured documentation contributes to long-term operational efficiency and knowledge continuity within IT teams. One of the most valuable benefits of this internship was the development of systematic problem-solving skills. Rather than relying on trial and error, I gradually learned to approach technical issues using hypothesis-based analysis, verification, and elimination. This mindset shift was especially evident when dealing with complex system deployment and troubleshooting tasks.

Challenge 1: Enterprise Image Deployment and .NET Framework 3.5 Installation Failure

One of the most challenging technical issues I encountered occurred after creating and deploying a standardized enterprise system image. During a subsequent deployment on new computers, I discovered that a required enterprise policy application failed because .NET Framework 3.5 could not be installed, despite multiple attempts.

‘

Initially, I hypothesized that the issue was caused by restricted access to Windows Update servers due to internal network security policies. However, this assumption was challenged when other Windows updates could be downloaded successfully on the same device. To further isolate the cause, I attempted to connect the device to a mobile hotspot, but the installation failure persisted, ruling out internal network restrictions. Next, I attempted to manually download and install the .NET Framework package from Microsoft’s official website. This approach also failed, suggesting that the issue was not related to network access or installation source availability. I then investigated whether the operating system itself was missing critical updates or security components. After reviewing Windows Update history and system version details, I discovered that the newly deployed Windows version required a specific security update and servicing stack update to be installed before it could access Microsoft’s servers to retrieve optional Windows features such as .NET Framework 3.5.

Once the missing security updates were installed and the system was fully updated, the .NET Framework installation completed successfully.

This issue taught me an important lesson about update dependencies and installation order, especially in enterprise image deployment scenarios. It also highlighted the necessity of thoroughly validating images after major Windows version updates.

Challenge 2: Uptime Kuma Deployment in Internal Server Environment

Another significant challenge occurred during the deployment of Uptime Kuma as part of the IT monitoring optimization project. After downloading the source code from GitHub and following official deployment documentation, I found that the service could not be successfully deployed on the company's internal server environment. Initial deployment attempts failed due to compatibility issues between the server's operating system environment and the required runtime dependencies, particularly Node.js version compatibility and network port restrictions imposed by internal firewall and security policies. Although the application could run in a basic test environment, it consistently failed when deployed within the internal production server.

To resolve this issue, I consulted colleagues from the Suzhou headquarters who had more experience with internal server environments. With their assistance, we adopted a Docker-based deployment approach, encapsulating Uptime Kuma and its dependencies into a containerized environment. This approach eliminated runtime dependency conflicts and simplified port mapping and service management. By deploying Uptime Kuma using Docker, we were able to successfully run the monitoring service on the internal server while complying with internal security and network policies. This experience introduced me to the concept of containerization, highlighted the benefits of environment isolation, and demonstrated the importance of selecting appropriate deployment methods in enterprise environments.

Challenge 3: Production Line Label Printer Print Quality Issue

I also encountered a practical troubleshooting challenge related to production line label printers, where printed labels appeared blurred and unclear, affecting barcode readability.

At first, I suspected a configuration issue, particularly related to print alignment or printer property settings. I compared the printer configuration with that of a functioning printer and

found no differences, allowing me to rule out software configuration issues. I then examined potential hardware-related causes, including label placement and mechanical alignment, confirming that both met operational standards. After eliminating configuration and setup issues, I focused on physical maintenance aspects and inspected the printer's print head. I discovered ink residue and contamination on the print head surface. After carefully cleaning the print head according to maintenance guidelines, the print quality returned to normal. This incident reinforced the importance of considering both software and hardware factors during troubleshooting and highlighted the value of structured fault isolation in production environments.

Through these challenges, I gained not only technical skills but also professional maturity. I learned to remain patient under pressure, communicate effectively with colleagues, seek assistance when necessary, and document issues and solutions for future reference. Overall, the internship significantly enhanced my readiness for future IT roles by providing hands-on experience in real enterprise environments. It strengthened my technical foundation, problem-solving mindset, and understanding of operational IT responsibilities, laying a solid foundation for my future career development in the IT field.

Challenge 4: Controlled Network Access and IP-Based Permission Configuration

Another challenge I encountered during the internship involved granting controlled external network access to specific employees while maintaining overall network security. In certain cases, employees required temporary or role-based access to external websites such as YouTube for work-related purposes, including technical research, training, or troubleshooting.

To implement this requirement, I followed a coordinated configuration process involving both the firewall and internal network services. First, I accessed the Sangfor firewall management system and created a policy that explicitly allowed outbound access to specific external websites for a designated internal IP address. This ensured that access was restricted to only authorized users and did not affect the broader internal network. After configuring the firewall policy, I proceeded to the Active Directory DHCP management console. To ensure that the user's computer consistently received the same IP address, I created a DHCP reservation by binding the assigned IP address to the device's MAC address. This step was

critical, as firewall rules based on IP addresses would fail if the IP changed due to DHCP reassignment.

During this process, I identified several potential issues and risks, and learned how to address them systematically:
First, there was a risk of IP address conflict if the reserved IP address overlapped with an existing static assignment or another DHCP reservation. To prevent this, I verified the DHCP scope, checked existing reservations, and ensured that the selected IP address was within the correct reservation range and not already in use.

Second, MAC address accuracy was essential. An incorrect MAC address would cause the DHCP reservation to fail silently, resulting in the user receiving a different IP address and losing firewall access. To avoid this issue, I confirmed the MAC address directly on the user's device using system commands and cross-checked it with DHCP records before applying the reservation.

Third, I considered the impact of device replacement or network adapter changes. If the user changed computers or network adapters, the MAC address would also change, causing the policy to stop working. To mitigate this, I documented the configuration clearly and informed relevant IT staff so that updates could be made promptly if hardware changes occurred.

Another potential issue involved policy precedence and firewall rule ordering. Even if an allow rule existed, higher-priority deny rules on the firewall could override it. To address this, I reviewed the firewall policy hierarchy and ensured that the new rule had appropriate priority and scope, while still complying with company security standards. Finally, I tested the configuration by verifying the assigned IP address on the user's computer, checking DHCP lease details, and confirming external access functionality. This validation step ensured that both the DHCP reservation and firewall policies were working as intended.

This task taught me the importance of coordination between network services and security systems, as well as the need for precise configuration and thorough validation. It also strengthened my understanding of access control, policy management, and risk-aware decision-making in enterprise IT environments.

5. Conclusion & Recommendations

This internship provided a valuable opportunity to experience the real working environment of enterprise IT operations and significantly influenced both my professional understanding and personal development. Through hands-on involvement in system deployment, network configuration, infrastructure maintenance, and end-user support, I gained a clear and realistic view of how IT systems support daily business and production activities. Compared with theoretical learning at university, this internship emphasized practicality, responsibility, and problem-solving, allowing me to better understand the role of IT in an organizational context.

One of the most significant impacts of this internship was the change in my perception of IT work. Before the internship, my understanding of IT was largely based on academic knowledge, such as operating system concepts, basic networking theory, and abstract system models. During the internship, I realized that real-world IT operations require not only technical knowledge but also careful planning, communication, documentation, and risk awareness. Many tasks involved balancing system security, operational efficiency, and user requirements, which is rarely reflected in purely theoretical coursework.

The internship also highlighted the difference between university education and industry practice. University courses tend to focus more on theoretical foundations, algorithms, and conceptual understanding, which are essential for building long-term technical capability. However, in the workplace, IT tasks are often driven by immediate operational needs, system stability, and business continuity. Practical skills such as troubleshooting, system standardization, hardware maintenance, and cross-department collaboration play a critical role in daily operations. This contrast helped me recognize that theory and practice are complementary, and neither can be neglected in professional development.

From a personal perspective, this internship strengthened my confidence in handling real technical tasks and improved my ability to learn independently. I became more familiar with IT hardware, enterprise systems, and infrastructure components, which allowed me to better understand how individual technologies are integrated into a complete operational environment. As I gained exposure to network configuration, firewall policies, access control, and monitoring systems, I developed a growing interest in networking and network

security. I realized that network security is a critical foundation for enterprise IT, as it directly affects system availability, data protection, and business continuity. Based on this experience, I am motivated to further develop my skills in the field of networking and security. In the future, I plan to strengthen my understanding of network protocols, security architecture, and enterprise-level network management. I also aim to enhance my practical skills by studying network troubleshooting methodologies, firewall and access control mechanisms, and security best practices. To improve along my academic and professional path, I would recommend myself to adopt a more practice-oriented learning approach during my university studies. This includes actively applying theoretical knowledge through labs, simulations, and personal projects, as well as gaining exposure to real-world tools and environments whenever possible. In addition, I should focus on developing stronger documentation and communication skills, as these are essential for effective collaboration in professional IT environments.

In conclusion, this internship served as a critical bridge between academic learning and professional practice. It not only enhanced my technical abilities but also helped clarify my career direction. By combining solid theoretical foundations from university with practical experience gained through internships and self-learning, I believe I will be better prepared to pursue a career in networking and IT security in the future.
